

Mantova, 11 november 2010  
Auditorium MPS, via Luzio 5/c – Mantova

The international experience of AlpEnergy has recently found an excellent contact point with the national planning in the new “Conto Energia”(PV tariff law), which will promote the production of electricity from solar sources for the period 2011-2013: the Law DLGS 06.08.2010 in fact specifies the new PV tariffs and conditions of access, introducing a new "bonus incentive" for plants managed as predictable load profile systems. Such foreseeable Systems have features which are very similar to those described in the Virtual Power System of the AlpEnergy project.

The international conference of Mantua will be an opportunity to learn more about AlpEnergy studies and results from its local developers, from electric cars as storage systems for energy produced by domestic PV plant, to the remote control of public lighting and the new possibilities related with the use of smart meters. It will give information about the new Italian PV tariff for 2011, just over a month ahead of the application of new rates and new scenarios for an electrical system which helps to turn the user from a passive to an active role.
